EFFECTIVENESS OF THERASUIT METHOD™ AND THE THERASUIT™
PILOT STUDY
RESULTS OF INTENSIVE EXERCISE PROGRAM IN
THE PEDIATRIC CEREBRAL PALSY POPULATION

IZABELA KOSCIELNY PT, RICHARD KOSCIELNY PT, (THERASUIT LLC/
PEDIATRIC FITNESS CENTER, 2141 CASS LAKE RD., SUITE 107, KEEGO
HARBOR, MI 48320, USA)

Objectives:
This study is part of a multi-site ongoing study and was designed to evaluate the
effectiveness of an intensive exercise program (TheraSuit Method™) using a Soft
Dynamic Proprioceptive Orthotic (TheraSuit™) on children with cerebral palsy by
measuring changes, which occurred after participating in a treatment session at the
Pediatric Fitness Center, Keego Harbor, Michigan.
The primary goal of the outcome study was the assessment of functional skills which
have the most influence on the quality of life.

Design: Ongoing study using a group pre-test/post-test design. A four-level diagnostic
algorithm has been designed for the complex evaluation of all participants. It includes the
preliminary selection, obtaining the initial data necessary to develop the individual
exercise program, collection of changes during and after the program and preparation of
the individual home exercise program.

Setting: Intensive Exercise Program at the Pediatric Fitness Center, Keego Harbor, MI.

Length of the study: The results of this study were obtained during treatment sessions

Patients: (20 children; 12 females and 8 males), with a mean age 6.3 (range of 2.5 to 13),
and with a primary diagnosis of cerebral palsy.

Materials/Methods:
During this study we used the TheraSuit Method™ and the TheraSuit™ (Soft
Proprioceptive Orthotic- protected by a patent as a “Neurological Motor Therapy Suit”).
All participants underwent evaluation pre and post exercise session. All data was
recorded using the Gross Motor Functional Measurement form. Additionally, all
participants were video recorded before and after treatment.
**Interventions:**
An intensive exercise program consisting of 3 hours of exercises, 5 times a week for 3 weeks was provided for the qualified participants. Treatment was administered by trained therapists/trainers in the Therasuit Method™. The intense program protocol included individually designed exercise programs for all participants including exercise with and without TheraSuit™.

**Measurements and Main Results**
All results were statistically evaluated. The results obtained from the study are presented in Fig.1 and Fig.2.
In this publication we included only part of the collected outcomes.
The study reveals functional improvements in 90% of the participants, additional progress was made in coordination by 56%, strength by 100%, range of motion by 100%, balance by 72% and movement control by 67%.
We noticed a significant improvement in the level of new functional skills learned by our participants during the exercise sessions. In the study group, 90% learned to roll independently, 75% learned to sit without assistance, 49% learned to crawl, 39% gained the ability to stand independently, 33% learned to walk with assistive devices and 21% gained the ability to walk independently.

**Conclusions:**
The results of our study confirm high effectiveness of the intensive exercise method (TheraSuit Method™) in conjunction with the Soft Dynamic Proprioceptive Orthotic (TheraSuit™).
In the future Therasuit LLC will continue to collect, analyze and compare data obtained from other facilities using the TheraSuit™ and TheraSuit Method™ according to the standards and quality established in the industry. We will update this study as soon as the results from other facilities are analyzed and published.
